

Good practices for sustainable tourism

**Vilafranca del Penedès, Santa Maria de Palautordera, Amposta.
2018.**

We can influence when it comes to performing good environmental practices in the bars and restaurants in several vectors. In a first phase can be worked on: water, energy and waste.

Water: this scarce good presents many forms of savings. These forms can be address to our clients as well as processes.

Processes: In the market exists efficiency systems such as the flow reducers. Easy to install and little expensive. They mix air and water and can save up to 25% of the consumption.

Clients: signs indicating that they do a proper use of water consumption may be sufficient to communicate our policy on water saving.

Energy: diversity of forms of savings. It starts with a good diagnosis, identifying what produces the maximum consumption. Usually it is the hot water sanitary and the air conditioning (cooling and heating).

Bulbs: Although by law all have to be of low consumption, they can be changed for the LED system (light emitting diode) that can get to save between 50 and 80% of the consumption.

Motion sensors for elevators, corridors, toilets and other rooms in which there are no customers for a long time.

Acquire appliances of low consumption in the wide range of devices that the market offers.

Waste: Initially you must apply the 4R maximum of waste management (reduce, reuse, recycle, recover).

Reduce: To choose products that have the smallest packaging possible (as far as possible cans and big boxes ...).

Reuse: why not to convert the organic waste (conveniently separated) in compound for the garden or the planters through a composter?

Recycle and recover: All waste generated must have a correct one management, with an adequate final destination (specific container...). As far as possible, products can be recovered to make a new use, for example, in the hospitality sector, we can recover the oils used to make soaps or, recover the glass bottles to make them serve again.
